

NOTES:

- When using these instructions, your zebra 621t printer should already be installed and ready for use. This document is specifically for adjusting the **Speed** and or **Darkness** of the label printer to improve print quality.
- The original speed setting should be fine when printing approved glossy synthetic zebra labels. This document specifically addresses the print quality of matte (non-shiny) or other (approved) label brands that may require a lower print speed setting to produce a darker print.
- Quality requirements for labels (synthetic, thermal transfer capable) still apply and any labels outside of what SLPH had recommended must be tested and approved for use by the SLPH.

STEP 1:

The printer should already be set up on your pc. Once setup, the printer settings can be changed by doing the following:

- Click the **Start** icon on your PC taskbar.
- Choose **Settings**
- **Bluetooth and Devices**
- **Printers and Scanners**
- Choose the Zebra Printer (ZDesigner ZD621-300dpi ZPL)
- **Printing Preferences**
- Select **Print Options**:
- The default **Speed** is set to 4.0"/s. See FIG 1 below. This setting should work for glossy synthetic zebra labels but matte (non-shiny) or other label options may require a slower setting to produce a darker print. Adjust the setting down to 2.0"/s. You should be able to compare labels and see a difference in print quality when lowering the speed.

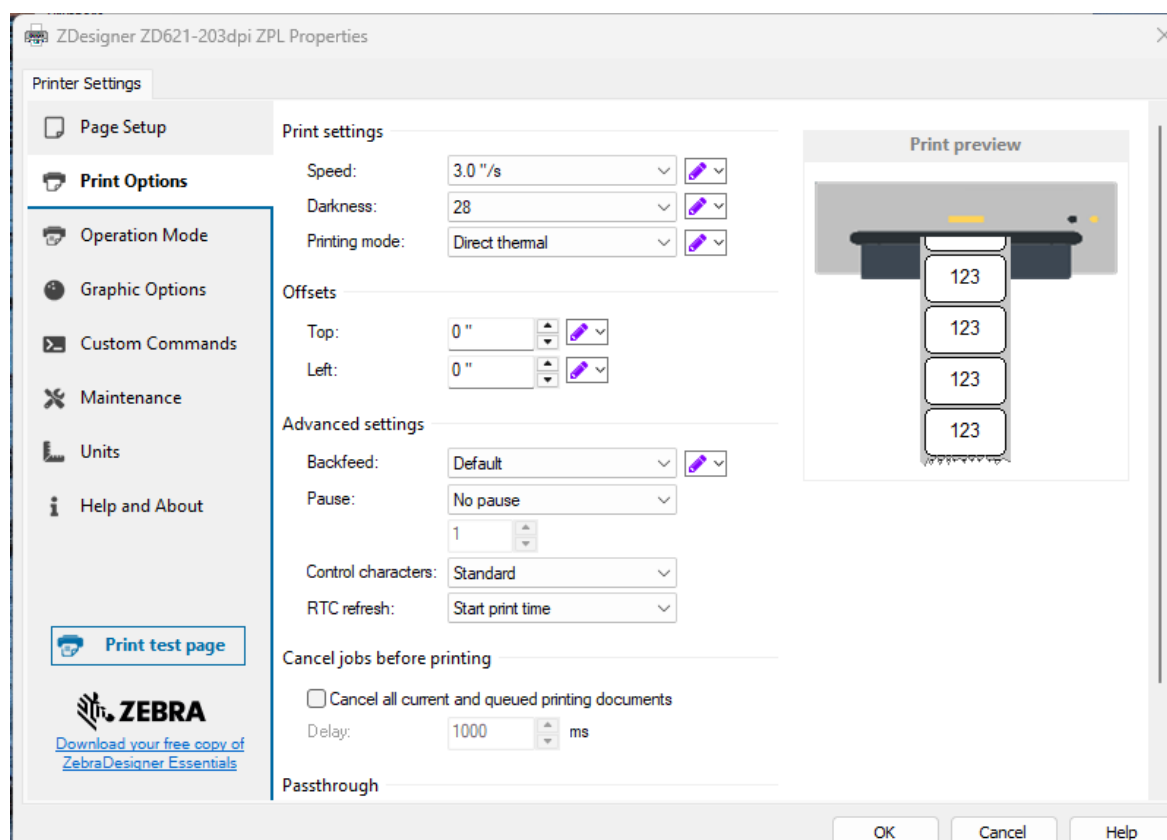

FIG1

- Confirm the **Darkness** is set to 25. See FIG 2 below.

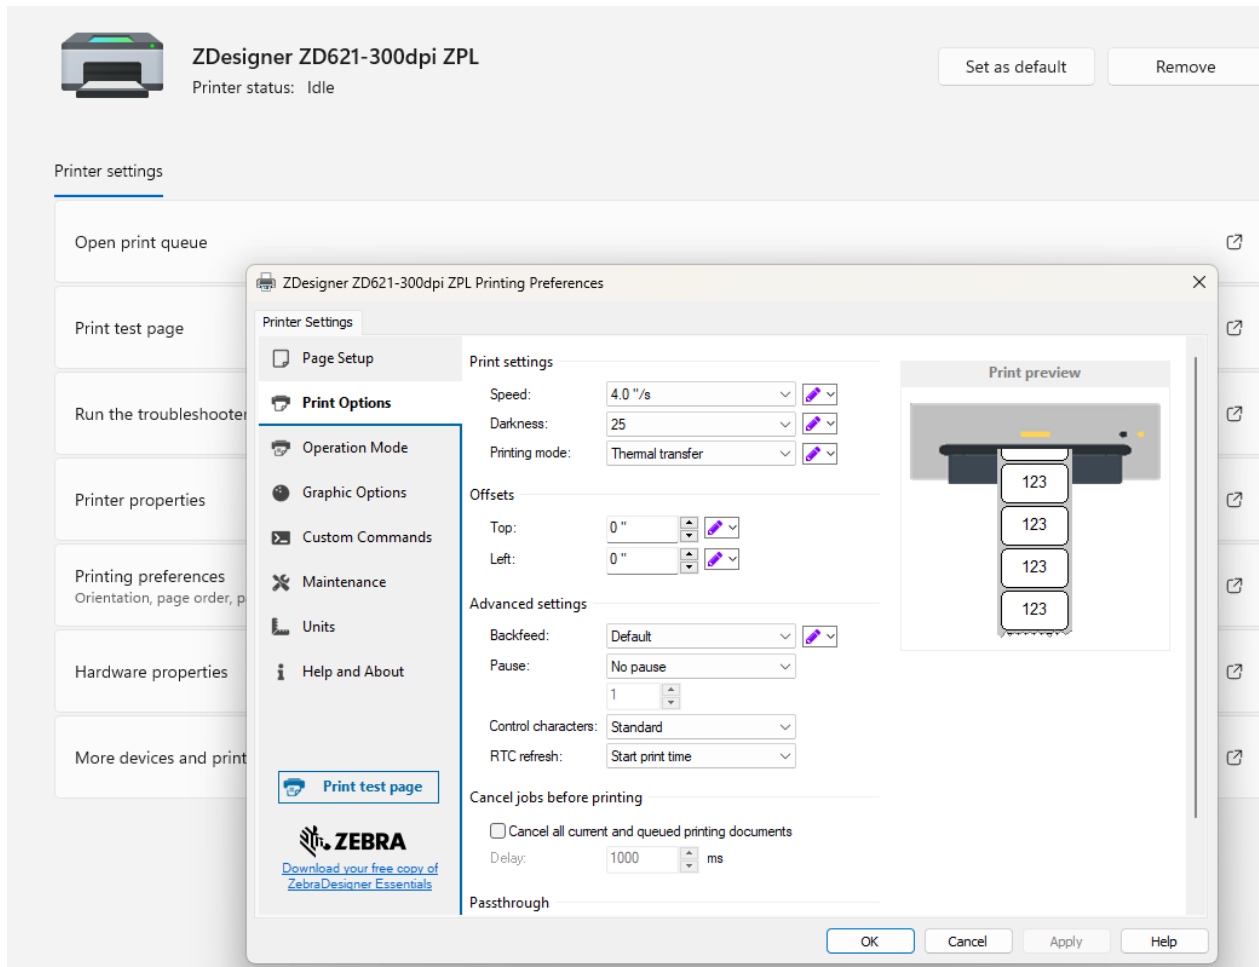

FIG2

- Select Apply/OK to close out the window.
